

5-26-2026

To Whom It May Concern:

It is my pleasure to formally acknowledge and recognize the participation of Mr. Jayakumar Ramalingam as a featured speaker at MinneAnalytics DataTech 2026, held on Friday, May 15, 2026, at Best Buy Corporate Headquarters in Richfield, Minnesota.

MinneAnalytics is one of the Upper Midwest's largest professional communities for data, analytics, and AI practitioners, and our DataTech conference is among the region's most well-attended events in the field. Speakers are selected through a competitive call for abstracts and reviewed by an organizing committee of senior industry practitioners. Only a select number of submissions are accepted each year, and selection is based on the originality of the proposed content, the speaker's demonstrated expertise, and the relevance of the topic to a sophisticated practitioner audience.

Mr. Ramalingam was selected to present the session "From Batch to Streaming: Data Architecture for Context-Aware Personalization." The session addressed an important and timely challenge in modern data architecture: how organizations can evolve recommendation and personalization platforms from batch-oriented pipelines toward streaming, nearline, and real-time systems that respond to current user context. His presentation traced a clear architectural progression from batch processing through streaming ingestion and feature stores to real-time retrieval and ranking, while also addressing the emerging role of generative AI in personalization. The content was substantive, current, and directly applicable to the work of data engineering, analytics, and machine learning practitioners.

Audience response to the session was strong. The talk drew engaged questions from senior data architects, analytics leaders, engineering practitioners, and AI professionals from across the region. Attendees responded positively to Mr. Ramalingam's clarity, depth of technical command, and ability to translate complex architectural concepts into actionable guidance for a working professional audience.

Mr. Ramalingam's contribution to DataTech 2026 reflects both deep subject-matter expertise and a generous willingness to share knowledge with the broader data community. We were fortunate to have him on our speaker roster, and we look forward to the opportunity to engage with him again in future programs.

Please do not hesitate to contact me directly if any additional confirmation or detail would be helpful.

Sincerely,

JOHN HOGUE
